Eisenhower Matrix: 3DFitter

	Urgent	Not Urgent
Important	**Do (Your MVP)** ● Take the size and fit type the user types in (eg java ThreeDFitter 10 slide) ● Four fit types (press, snug, slide, loose), each with a set gap in mm ● Work out and print the hole and peg sizes to use in CAD ● Calibration: type in the planned size and the measured size of a test print, and the tool works out and saves that printer's offset to a file, then uses it in every result ● Show a clear error message for bad input (letters, negative sizes, unknown fit types) or a missing offset file	**Schedule (For V2.0+)** ● Save offsets for more than one printer or filament (eg --profile bambu-petg) *week 12 build.* ● Different offsets for holes and for pegs ● Use the average of several test prints for a better offset ● User-made fit types (eg "my-snap-fit = 0.15 mm") ● Slots and square shapes, not just round holes and pegs
Not Important	**Delegate (Use a library)** ● Saving the offset: Java's built-in Properties class ● Checking the math: JUnit ● Reading numbers: Java's built-in Double.parseDouble ● Calibration test print: a free Printables model with a labeled hole or peg size ● Starting gap sizes: numbers from common 3D printing guides, hardcoded in the program	**Delete (Cut it)** ● ISO fit tables for machined metal parts ● A window-based app or website ● A plugin that sends sizes into Onshape or Fusion 360 ● Guessing the offset from slicer settings or G-code ● Phone app
